

TIDE STEADILY FLOWS AGAINST HENRY BEATTIE

(Continued From First Page.)

ceded by a woman's scream, and that if Beattie shouted for help and blew his horn, as he said, these things were not heard by three nearby residents who yet heard the gun go off and the automobile start.

It has been shown that Beattie says he found his wife dead when he returned to the automobile after wrestling the gun from the highwayman, the body not leaving the machine until taken out at the Owen home.

It has described the blood spot in the road and produced the automobile for inspection by the jury, with a view to showing that the blood could not have dripped from or through it, and that Mrs. Beattie must have been in the road when killed.

It has shown that dirt was in her hair, as if she had fallen in the road. It has shown that Beattie says he threw the gun in the back part of the automobile before he touched the body of his wife, leaving the inference that his hands were then free of blood.

It has produced a witness who swears there were bloody finger-prints on the gun and who gives the names of at least two others who saw them. It has described certain tell-tale footprints near the tree-stump in the road, but has failed to prove conclusively that they could not have been made by some other person.

What it will now try to do. This much the Commonwealth has done so far, with some minor additions. In the main its witnesses have gone through the storm unshaken. As to the citations above they swear absolutely. There is no middle ground. Either they are telling the truth or else deliberately misstating the facts and risking a human life. The defense will endeavor to impeach some of them.

The strength of the State's case can be seen from this brief summary. And as indicated before, the State is not much more than half through. From now on its object will be:

To get before the jury certain evidence indicating a clear motive for the crime.

To produce out of its long list enough witnesses to strengthen what has gone before where this may be deemed necessary.

To show that a pedestrian who went along the road that night and saw Beattie's car failed to meet any person answering to the description of the man with the gun.

To drag in somehow the reason why nobody else went with the younger Beatties on the night of the murder-to-wit: the instructions of Henry Beattie to his wife.

To show that Paul Beattie bought the gun at the request of his cousin, paid for it with his cousin's money, and delivered it to his cousin three days before the alleged crime occurred.

To produce the aforementioned climax and sensation, character unknown, but said to be startling and imminent.

Whether or not the State can do all these things, the next two days will determine. It will certainly try and will certainly meet force with force. The hearings will be the most interesting yet held.

Mathematical Demonstration. Upon one vital point the prosecution claims to have reduced its testimony practically to a mathematical demonstration which has gone beyond the questioning and doubtful stage. Here it is:

With his wife, Beattie left the Owen home about 10:12 P. M., and went in toward Manchester to leave a prescription at a drug store. Then he turned and went back "for a spin" along the Middlethian Pike, a machine resembling his being seen by Dr. W. F. Mercer to pass the Owen house about 10:30 P. M.

The murder occurred shortly before 11 P. M., and Beattie was back at home with the dead body of his wife probably by 11:10 P. M. The story was known in Richmond by 11:25 P. M.

There can be no doubt, therefore, that the Beattie car was on the pike between 10:30 P. M. and 11 P. M. Richmond boys, attending a dance at Bon Air, left there on the return trip (between 10 P. M. and 10:30 P. M.) traveling in two fast automobiles. As a matter of fact, one of the boys looked at his watch just before he started from Bon Air, and it was then 10:30 P. M. His machine reached Richmond at 10:55 P. M., and the second machine saw the City Hall clock at 11:05 P. M. These two cars traversed the Middlethian Pike during the interval in which Beattie was also on the road. They

passed two other automobiles, and only two. One contained several passengers and was running toward Bon Air. Manifestly this was not Beattie's. The other was standing still on the road. Manifestly, unless the car must have been Beattie's, this must have been his car. He started out from one end of the pike at 10:30 P. M., and the boys from the other end at the same hour. They had to pass somewhere. If the boys met only two cars, and one of them was not Beattie's, the other must have been, whether it was standing still or moving or doing anything else. Identified or not identified, it could not have been otherwise, the Commonwealth asserts. But in addition to this witnesses swear.

That the standing car had a yellow top, such as Beattie's.

That the rear doors were off, such as Beattie's.

That the car contained but two people, a man and a woman, such as Beattie's.

That the woman wore a long tan coat, such as that worn by Beattie's wife.

Here the Commonwealth claims it has produced proof clear and convincing of at least one fact—that Beattie brought his machine to a halt in the neighborhood of the crime a few moments before the crime occurred. But Beattie says he did not stop until the loaded highwayman stepped into the road. The boys saw no highwayman.

As to the Defense. There is no purpose here to convict Beattie out of court. Beyond all else these articles will try to give him credit for what he knows—no more and no less—regardless of any personal opinion. The object is simply to summarize the case in its present condition from the point of view of the Commonwealth. With the defense a sealed book as yet, no other point of view is possible. Necessarily, until the prisoner speaks, it is a one-sided picture.

As to what the defense managed to get out of the opening days it is little enough. The first skirmish on Thursday was undeniably a failure on the part of the Commonwealth and correspondingly a source of comfort to the other side. In the State's camp there was no contention that day and night. Since then it has been different. The defense successfully prevented the uncle of the dead girl or rather the witness himself refused to reveal the reason why Beattie and his wife went out alone that night, which reason he knew only by hearsay. The distance between the point at which the automobile crossed the Bell Line track and the point at which the gun was found was materially reduced, showing that the weapon might have been jolted out.

Conflicting statements were made by two Commonwealth witnesses as to the character of the crossing with reference to the likelihood of getting a heavy jolt there. Roland Snyder, the dairyman, who saw a solitary rider near the scene of the murder early in the evening, though convinced in his own mind, could not positively identify Beattie or the car before the jury. One or two of the Richmond boys became entangled on cross-examination, serving to weaken their individual testimony somewhat, though not essentially. The envelope on the "Dear Kid" letter, containing the only date borne by the mislaid, was excluded from the record. Ground was laid for the impeachment of certain witnesses, particularly with reference to what they heard and failed to hear before and after the shot. Witnesses had to confess that they could not swear the footprints at the stump could not have been made by some other person. The Commonwealth has been bound down and limited by every technicality that could be invoked. A great mass of exceptions is gathering for the Supreme Court—should they be needed.

Whatever it may be worth in the end, the defense has at least done this much. Between now and the conclusion of the prosecution's case it may add to its accumulation and then bring its own case forth.

Gloomy Prospect. So stands Henry Beattie now. At the beginning of the second week of his trial he faces no cheerful prospect. The Commonwealth's hand seems very strong and it has several big cards yet to play.

The jury looks on and the crowd watches the jury. Behind those faces is forming the future of the prisoner. The twelve countrymen are much in the limelight now.

The court is able and firm. The presiding judge, with fine courtesy and tact, has won the hearts of all. The crowds obey his will unquestioningly. The lawyers draw their quibbles when he speaks. Watson's daily lustre to a name already distinguished.

FISH SO THICK THEY BLOCK HARBOR MOUTH

Record Run of Porgies Crows Water On Portland, Me., and Fishermen Catch 24,000,000.

Portland, Maine, August 27.—A record catch of 24,000,000 porgies was reported here yesterday, and captains of incoming vessels said that the mouth of the harbor was literally alive with packed fish, making it practically impossible to force a path through them.

The run began several days ago, and the news was telegraphed to the eastern part of the State. A porgie plant was at once sent here, and since its arrival the business has been very brisk. Not only did the plant engage in catching the large number of porgies, but many schooners also set out for the grounds, and their success was heralded far and near, until it would seem as though every man who owned a boat of any kind would be out on the water, and that the harbor would be a mass of boats. The harbor's mouth. Many Italian fishermen in Hampton boats went out and succeeded in getting thousands of the squirming fish. Peddlers in bum-boats also were fortunate in making catches which netted what to them seemed large fortunes.

The first report of the work being done outside was brought in by Captain Simmons, of the lobster smack Katie C. Lamson, who said that when passing between Half-Way Rock and Small Point the waters became alive with fish. He thought they were mackerel at first, and started to dig for them, but as soon as the small nets were placed in the water the fish separated and would not approach them. They were extremely wild. It was then that Captain Simmons noticed a number of big steamers near at hand sailing the porgies in immense nets.

"They were the biggest I ever saw," said Captain Simmons, and it is reported that they were a mile long. When these seines were pulled the number of fish taken in seemed to be beyond calculation.

Disturbance Is Recorded. New Orleans, La., August 27.—A noticeable disturbance was recorded on the seismograph at Loyola College in this city at 4:05 o'clock this morning, which lasted until 4:50 this morning. The maximum vibrations measured five millimeters.

What the Weather Man Has in Store This Week

Washington, D. C., August 27.—Rains within the next forty-eight hours over the greater part of the country from the Mississippi Valley south to the Gulf of Mexico and in the Southwest are predicted to-day in a bulletin of the Weather Bureau. Strong winds are forecast off the Atlantic Coast in connection with the disturbance now off the South Atlantic Coast. Following the passage of these disturbances the pressure will rise rapidly, and a change to considerably more weather will overspread the great Central valley and the Lake region to-morrow and the Eastern and Southern States Tuesday and Wednesday. This change to cooler weather probably will cause frost in exposed places the first part of the week in the Northern Rockies, Northern Plains States, extreme upper Mississippi Valley and the upper Lake region. Another disturbance is due to appear in the Northwest about Wednesday, whence it will move eastward.

Washington, D. C., August 27.—Rains within the next forty-eight hours over the greater part of the country from the Mississippi Valley south to the Gulf of Mexico and in the Southwest are predicted to-day in a bulletin of the Weather Bureau. Strong winds are forecast off the Atlantic Coast in connection with the disturbance now off the South Atlantic Coast. Following the passage of these disturbances the pressure will rise rapidly, and a change to considerably more weather will overspread the great Central valley and the Lake region to-morrow and the Eastern and Southern States Tuesday and Wednesday. This change to cooler weather probably will cause frost in exposed places the first part of the week in the Northern Rockies, Northern Plains States, extreme upper Mississippi Valley and the upper Lake region. Another disturbance is due to appear in the Northwest about Wednesday, whence it will move eastward.

What the Weather Man Has in Store This Week
